DOS3.AI | ORGANISATION WEBSITE GUIDE

Website Playbook

Advanced guidance for building a top-tier AI company website: strategy, content, design, technical foundation, trust and launch.

Executive summary

This playbook is the advanced guide for building the DOS3.AI website as a credible, enterprise-grade AI company site. It covers what to decide, what to build, what to say, what to prove and what to avoid. Every item is written so you can act on it directly. Anything in [square brackets] is a placeholder for a fact only you can supply: never publish a claim you cannot substantiate.

Seven principles of top-tier AI company websites

#	Principle	What it means for DOS3.AI
1	State what you do in 5 seconds	A visitor must be able to say who the product is for and what outcome it gives after reading only the hero.
2	Show the product, not stock art	Real interface, architecture diagram, code or demo. Abstract orbs and robot photos signal a vague company.
3	Prove everything	Metrics, benchmarks with methodology, named customers or design partners, certifications you really hold.
4	Make trust a feature	Security, privacy and Responsible AI get their own pages and a homepage band, not a footer link.
5	One primary action per page	Usually 'Book a demo' or 'Request access'. Secondary actions must not compete.
6	Fast, accessible, indexable	Core Web Vitals in the green, WCAG 2.2 AA, clean semantic HTML, structured data.
7	Built for people and AI answer engines	Answer-first copy and consistent facts so Google, ChatGPT, Claude and Perplexity describe you correctly.

1. Positioning before pixels

Decide these before design starts. Weak positioning cannot be fixed by good visuals.

Decision	Question to answer	Your answer
Category	Which category do buyers already search for? (e.g. AI infrastructure, MLOps platform, enterprise LLM platform, AI data platform)	[ ]
Ideal customer (ICP)	Company size, industry, buyer title, technical level, budget owner	[ ]
Core problem	The one painful, expensive problem you remove, in the customer's words	[ ]
Mechanism	How you solve it differently (architecture, approach, data advantage)	[ ]
Proof	Numbers, customers, benchmarks, pilots, certifications, patents	[ ]
Primary action	Book demo, request access, join waitlist, start free	[ ]

One-line positioning formula
DOS3.AI is the [category] that helps [ICP] [achieve outcome] by [mechanism], so they can [business result].

Use your name as a story, once

Your tagline already expands the name: **Data, Operating Systems, Servers, Services, AI**. If those are genuinely the five layers of your platform, make that the structural story of the homepage: one diagram, five layers, one outcome. If they are only a naming idea, use the expansion in the About page and keep the homepage focused on the outcome.

Name risk to manage
Searches for 'DOS' are dominated by MS-DOS and by 'DoS' (denial of service) security topics. Mitigate it: always write the full **DOS3.AI**, claim every major profile with identical naming, implement Organization structured data with *sameAs* links, and run a USPTO trademark search with an attorney before heavy brand spend.

Message hierarchy

Level	Rule	Draft directions (pick only what is true)
Headline	At most 10 words, outcome first, no buzzwords	'From raw data to production AI, on one platform.' / 'Intelligent infrastructure for AI-native teams.' / 'Build, serve and govern AI on infrastructure you control.'
Subhead	At most 25 words: who, what, how	'DOS3.AI unifies [data, compute and AI services] so [ICP] can ship [LLM and ML workloads] faster, with security built in.'
Three pillars	Outcome headline plus one proof line each	[Speed], [Cost], [Control and security]
Proof	Number plus context plus source	'[X]% lower inference cost on [workload], measured [date], method on request.'
CTA	Verb plus object, specific	'Book a 30-minute architecture demo'

2. Site architecture

A lean, complete sitemap beats a large one. Launch with the pages marked **Core**; add the rest as proof accumulates.

Page	Priority	Purpose and must-have content
Home	Core	Hero, proof strip, platform overview, capabilities, how it works, use cases, trust band, developer teaser, final CTA
Platform / Product	Core	One overview plus one page per module (Data, OS, Servers, Services, AI) if real. Architecture diagram, specs, integrations
Solutions	Core	By industry or use case (e.g. financial services, healthcare, SaaS, public sector). Problem, solution, result
Security and Trust	Core	Trust center: controls, certifications, data handling, subprocessors, pen-test summary, security contact
Responsible AI	Core	Policy on data use, model evaluation, human oversight, bias and safety testing, incident handling
Pricing / Engagement	Core	Public tiers or a clear engagement model ('Pilot, Production, Enterprise') with what each includes
About	Core	Mission, founders with real bios, advisors, investors, location in the USA, story behind the name
Contact / Demo	Core	Short form, calendar booking, security and sales emails, response-time promise
Developers / Docs	High	Quickstart, API reference, SDKs, code samples, changelog, status link
Customers / Case studies	High	Challenge, approach, measured result, quote, logo with written permission
Research and Insights	High	Technical posts, benchmarks, whitepapers: your search and credibility engine

Page	Priority	Purpose and must-have content
Careers	Medium	Values, open roles, hiring process, benefits. Strong signal for investors and talent
Press and Brand kit	Medium	Boilerplate, logos (SVG and PNG), founder photos, fact sheet, press contact
Legal set	Core	Privacy Policy, Terms, Acceptable Use, Cookie Policy, DPA, Accessibility Statement
Status page	Medium	Uptime and incident history on a separate subdomain

Navigation rule
Top nav: Platform, Solutions, Developers, Security, Company, plus a single highlighted button (Book a demo). Maximum 6 items. Keep the logo link pointing home and the nav sticky on desktop.

3. Homepage blueprint, section by section

#	Section	What to include	Notes
1	Navigation	Logo (horizontal lockup), 5-6 links, CTA button	Sticky; collapse to a clear mobile menu
2	Hero	Outcome headline, 25-word subhead, primary and secondary CTA, product visual or animated architecture	Everything above the fold must load fast; no autoplay audio
3	Proof strip	Customer or partner logos, accelerators, cloud or GPU partner programs, press, certifications	Only logos you have permission to show. Pre-customer: advisors, investors, design partners
4	The shift	Three sentences: the old way, why it breaks, what changed	Plain language, no jargon stack
5	Platform overview	Diagram of the five layers (Data, Operating Systems, Servers, Services, AI) and how they connect	One visual that people remember and can screenshot
6	Capabilities	3 to 6 outcome cards, each with headline, one line, one proof metric, link to detail	Outcome first, feature second
7	How it works	3 or 4 steps with a real UI or code visual	Ends with a link to docs or demo
8	Use cases	By persona (ML engineer, CTO, CISO) or industry	Each card links to a Solutions page
9	Proof	Case study with numbers, quote, benchmark with disclosed method	Specific beats impressive
10	Trust band	Security controls, compliance status, Responsible AI commitments	Link to Trust page
11	Developer teaser	Short code snippet, SDK languages, docs link	Shows the product is real
12	Final CTA	Restate outcome plus single CTA	Same wording as hero CTA

#	Section	What to include	Notes
13	Footer	Full navigation, legal links, social links, US address, contact, status	Include the exact company legal name

Pre-revenue or early stage?
Do not fake traction. Replace customer logos with: founders' credentials, advisors, accelerator or cloud-credit programs you were accepted into, pilot or design-partner descriptions (named only with permission), a waitlist, and a technical demo. Honest specificity builds more trust than inflated logos.

4. Trust, security and Responsible AI

For AI infrastructure, trust is the product. Enterprise buyers send a security questionnaire before they talk pricing, so your site should answer most of it in advance.

Area	What to publish (only what is true)	Status to show
Security framework	SOC 2 Type I then Type II roadmap; ISO/IEC 27001	Held / In progress with target date / Planned
AI governance	ISO/IEC 42001 (AI management systems), NIST AI Risk Management Framework alignment	Honest status
Privacy	CCPA/CPRA and applicable state privacy laws, GDPR readiness for EU users, HIPAA only if you sign BAAs	Policy plus DPA
Data handling	Encryption in transit and at rest, tenant isolation, data residency options in the USA, retention and deletion, whether customer data is used to train models	Plain-language table
Access control	SSO/SAML, role-based access, audit logs, MFA, least privilege	Feature list
Assurance	Annual third-party penetration test summary, vulnerability disclosure policy, security.txt, bug bounty if any	Link and contact
Reliability	Uptime target or SLA, status page, incident communication process	Link
Supply chain	Subprocessor list with update notice, model and cloud providers used	Table
Responsible AI	Evaluation and red-teaming approach, human oversight, bias testing, content safety, model cards or system cards where relevant	Short public policy

Legal accuracy rule
The US FTC and SEC have taken enforcement action against companies that overstated their AI capabilities ('AI-washing'). Every capability, benchmark, customer and certification on the site must be provable. Keep a private evidence file for each claim.

5. Copywriting standards

- **Concrete over abstract.** 'Cut inference cost by [X]% on [workload]' beats 'revolutionary AI platform'.
- **Write for three readers:** the executive (outcome and risk), the engineer (architecture and docs), the security reviewer (controls). Give each a clear path.
- **Active voice, sentence case, plain verbs.** Aim for a reading level around grade 8 to 10, even on technical pages.
- **One idea per section, one job per sentence.** Cut filler and any sentence that could appear on a competitor's site.
- **Every number needs context:** what was measured, on what hardware or data, when, and by whom.
- **Specific CTAs:** 'Book an architecture demo', 'Read the benchmark report', 'View the API docs'. Avoid 'Submit' and 'Learn more' on key buttons.

Words to avoid unless you can prove them

revolutionary, cutting-edge, next-generation, world-class, seamless, best-in-class, state-of-the-art, game-changing, unparalleled, 10x, 'powered by AI' (as a headline), 'AGI'.

Case study template

Block	Content
Customer	Name, industry, size, use case (with written permission)
Challenge	The measurable problem in their words
Approach	What was deployed, in which environment, how long it took
Result	Three metrics with before and after, plus time frame
Quote	One sentence from a named person with title
Next	CTA to talk to the team or see the architecture

Benchmark disclosure checklist

[ ] Model, dataset, hardware, software versions and date

[ ] Baseline you compared against and why it is fair

[ ] Metric definitions and how many runs

[ ] Link to reproducible method or offer it on request

6. Design system and UX

Your logo already defines a distinctive palette: electric cyan into azure, indigo and violet, with a magenta accent on a near-black base. Use it with discipline.

Token	Hex	Use
Void navy	#04050F	Page background (dark theme)
Midnight	#0A1030	Cards, headers, dark text on light backgrounds
Electric cyan	#22E6FF	Highlights, links on dark, data accents
Azure	#2F6BFF	Primary buttons and key UI
Indigo	#3A2BFF	Gradient mid-tone, hover states
Violet	#9B4DFF	Secondary accent, '.AI' in wordmark
Magenta	#E23CFF	Rare accent, one per screen at most
Mist	#C9D4F5	Secondary text on dark
Cloud white	#F4F7FF	Primary text on dark

Typography

Headlines: **Sora** (ExtraBold or Bold), matching the wordmark. Body and UI: **Inter** (400, 500, 600). Both are open-source and free for commercial use. Use a type scale (for example 14, 16, 20, 28, 40, 56 px), maximum line length around 70 characters, line height 1.5 for body.

Rules that create a premium feel

- Spend the gradient in one memorable place per screen (hero mark or one key heading). Keep the rest quiet.
- Dark theme by default with a light theme option; body text contrast at least 4.5:1 and large text at least 3:1.
- 8 px spacing grid, generous whitespace, one consistent corner radius family.
- Real product visuals: interface, live architecture diagram, code. Avoid generic stock robots and glowing brains.
- Motion: one orchestrated entrance at most, subtle hover and focus states, and full support for prefers-reduced-motion.
- Mobile first: a large share of LinkedIn and email traffic arrives on phones. Test at 360 px wide.
- Include a visible keyboard focus ring and descriptive alt text on all meaningful images.

7. Technical foundation and SEO

Recommended stack

A static-first framework (Next.js or Astro) with a headless CMS, deployed on a global edge network (Vercel or Cloudflare). Keep marketing pages statically generated and your app on a separate subdomain (for example app.dos3.ai, docs.dos3.ai, status.dos3.ai).

Area	Target or requirement
Core Web Vitals (75th percentile)	LCP at most 2.5 s, INP at most 200 ms, CLS at most 0.1; verify with PageSpeed Insights and Search Console
Accessibility	WCAG 2.2 level AA; test with keyboard only and a screen reader; publish an accessibility statement
On-page SEO	One H1 per page, unique title (about 60 characters) and meta description (about 155), canonical URLs, clean URL slugs, internal links between related pages
Indexing	XML sitemap, robots.txt, Google Search Console and Bing Webmaster Tools verified, no accidental noindex
Structured data (JSON-LD)	Organization (with logo and sameAs links to LinkedIn, GitHub, X, Crunchbase), WebSite, SoftwareApplication or Product, FAQPage, Article, BreadcrumbList
Social sharing	Open Graph and Twitter card images at 1200 x 630 px; test with LinkedIn Post Inspector
Security headers	HTTPS everywhere, HSTS, Content-Security-Policy, X-Content-Type-Options, Referrer-Policy, Permissions-Policy
Domain and email security	Registrar MFA and registry lock, DNSSEC, SPF, DKIM, DMARC set to quarantine then reject, security.txt at /.well-known/
Analytics	Privacy-friendly tools (Plausible, PostHog or GA4 configured carefully), UTM naming standard, CRM integration, consent for tracking tags
Forms	Spam protection, double-submit prevention, instant confirmation, routing to CRM, auto-reply with next steps

Be discoverable by AI answer engines (GEO)

- Publish a clear 'What is DOS3.AI?' definition on the About page and homepage, using the same wording everywhere.
- Write answer-first FAQs and comparison pages ('DOS3.AI vs [alternative approach]') with honest trade-offs.
- Keep facts consistent across website, LinkedIn, Crunchbase, GitHub, G2 and press, since models and search engines cross-check them.
- Decide deliberately which AI crawlers (for example GPTBot, ClaudeBot, PerplexityBot, Google-Extended) you allow in robots.txt. Allowing them improves visibility; blocking them protects content.
- An optional llms.txt file summarizing your site is an emerging convention. It is cheap to add but not guaranteed to be used by any engine.

- Target keyword clusters (validate with a tool such as Ahrefs or Semrush): AI infrastructure, enterprise LLM deployment, MLOps platform, private LLM hosting, AI data platform, AI governance. Build a pillar page per cluster plus supporting technical articles.

8. Legal and compliance (United States)

Have a startup attorney review these before launch. This section is a checklist, not legal advice.

[ ] **Privacy Policy** covering data collected, purposes, sharing, retention, and rights under CCPA/CPRA and other state laws (including Texas), with a contact method

[ ] **Cookie banner and preference center** that blocks non-essential tags until consent where required

[ ] **Terms of Service and Acceptable Use Policy** including AI-specific rules (prohibited uses, output responsibility)

[ ] **Data Processing Addendum** and subprocessor list for business customers

[ ] **AI disclosures:** where AI generates content or interacts with users, say so; describe data use for training

[ ] **Copyright and DMCA agent** registration if users can upload content

[ ] **Accessibility statement** and a way to report problems (ADA exposure is real for US sites)

[ ] **Entity details in the footer:** exact legal name, state of formation, mailing address

[ ] **Trademark:** clearance search for DOS3.AI and the logo, then file with the USPTO

[ ] **Testimonial and logo permissions** stored in writing

[ ] **Open-source licenses** for any code or fonts used (Sora and Inter are under the SIL Open Font License)

9. Conversion system

Element	Standard
Primary CTA	One per page, same label on hero and final section, always visible in the nav
Demo form	Five fields at most: name, work email, company, use case, optional message. Qualify later in the follow-up
Response promise	'We reply within one business day' and then keep it. Route instantly to a named owner
Lead magnets	Technical whitepaper, benchmark report, reference architecture, AI governance checklist. Gate only the highest-value ones
Calendar	Embedded booking with a short pre-call question, confirmation email with agenda
Retargeting	Install LinkedIn Insight Tag and ad pixels only with consent; build audiences by page group (pricing, docs, security)
Waitlist (pre-launch)	Collect work email and use case; send a short welcome email within minutes

10. Launch plan and quality assurance

Phase	Focus	Deliverables
Days 1-30	Strategy and content	Positioning doc, messaging hierarchy, sitemap, wireframes, copy for Core pages, proof inventory, legal drafts
Days 31-60	Design and build	Design system, homepage and Core pages, CMS, analytics, SEO foundations, security headers, trust page, accessibility pass
Days 61-90	Launch and learn	QA, load and device tests, redirects, Search Console, announcement on LinkedIn, first 3 technical articles, first A/B test on hero

Pre-launch checklist

- [ ] Every claim, number and logo is documented in an evidence file
- [ ] All forms tested end to end into the CRM, with alerts working
- [ ] Page speed and Core Web Vitals pass on mobile
- [ ] Keyboard and screen-reader test passed; contrast verified
- [ ] Title, description, canonical, Open Graph and schema validated on all Core pages
- [ ] 404 page, redirects, XML sitemap, robots.txt, favicon and app icons live
- [ ] SPF, DKIM and DMARC verified; HTTPS and HSTS active
- [ ] Cookie consent works; tags fire only after consent
- [ ] Legal pages reviewed by counsel; footer entity details correct
- [ ] Social profiles use identical name, logo and description

Metrics to track monthly

Metric	Why it matters	How to use it
Visitor to demo-request rate	Message and offer strength. Many B2B sites land in the low single digits; treat this only as a rough starting point	Run one A/B test per month on hero or CTA
Qualified demos booked	Pipeline quality, not just volume	Review source and ICP fit
Non-brand organic impressions	SEO and category reach	Grow with new pillar content
Brand search volume for 'DOS3.AI'	Brand awareness; shows name risk is being overcome	Track in Search Console
Top landing pages and drop-off	Where the story breaks	Fix the weakest high-traffic page first
Time to first response	Sales credibility	Target under one business day
Core Web Vitals	User experience and ranking	Keep all in the green

Top mistakes to avoid

- Launching with vague copy ('AI-powered everything') and no clear customer.
- Inflated or unverifiable claims, fake logos, or stock testimonials.
- Hiding security and privacy, or claiming certifications you do not hold.
- Heavy animations and 3D that wreck mobile performance and accessibility.
- Many CTAs competing on one page, and long forms that kill conversion.
- No ongoing content: a static site stops compounding after launch.
- Inconsistent brand name or description across the web.
